

All current studies have proven that BPL will render the HF radio spectrum virtually useless for communication. The interference will negate the ability for several emergency response groups (both civilian and military) to communicate when most needed - during emergencies. Not to mention all the day to day readiness practice that goes on in this spectrum to be prepared for emergencies. I sincerely hope the FCC would reconsider it's ruling and take head of the comments stated by FEMA and ARRL. What is the big rush to push BPL when there are many alternatives to have consumers obtain internet services? Is the FCC now more concerned with pleasing commercial corporate interests? In this day and age of terrorism alerts and threats, the last thing you should be doing is impeding the abilities of emergency response groups.
